JSTOR is a digital library of academic journals, books, and primary source objects. JSTOR helps people discover, use, and build upon a wide range of content through a powerful research and teaching platform, and preserves this content for future generations. JSTOR is part of ITHAKA, a not-for-profit organization that also includes Ithaka S+R and Portico. For more information about JSTOR, please contact support@jstor.org.

PREVALENCE OF DISEASE.

No health department, State or local, can effectively prevent or control disease without knowledge of when, where, and under what conditions cases are occurring.

IN CERTAIN STATES AND CITIES.

RECIPROCAL NOTIFICATION.

Minnesota.

Cases of communicable diseases referred during December, 1914, to other State or provincial health departments, by the Division of Preventable Diseases of the Minnesota State Board of Health.

Disease and locality of notification.	Referred to health authority of—	Why referred.
Smallpox: Mankato, Blue Earth County.	Lake Park, Dickinson County, Iowa.	Contracted smallpox from a boy who was visiting from Lake Park, Iowa.
Tuberculosis: Pokegama, Pine County.. Madison, Lac Qui Parle County.	Chicago, Cook County, Ill.. Albee, Grant County, S. Dak.	Left Pokegama for Chicago, Ill. Present residence, Albee, S. Dak.
Typhoid fever: Shakopee, Scott County.. Hendricks, Lyon County.	Denzil, Saskatchewan, Canada. Brookings County, S. Dak...	Lived in Denzil three weeks previous to first symptoms. Contracted typhoid fever from daughter, who died Nov. 9, 1914. Present residence, Brookings County, S. Dak.
Park Rapids, Hubbard County.	Lily, Day County, S. Dak...	Three weeks previous to earliest symptoms, patient was farming near Lily, S. Dak.

CEREBROSPINAL MENINGITIS.

Virginia—Pardee.

The State Commissioner of Health of Virginia reported January 23, 1915, that cerebrospinal meningitis had been reported prevalent at Pardee, Wise County, Va., and that several deaths had resulted from the disease.

Texas Reports for August and September, 1914.

The State board of health reported that during the month of August, 1914, poliomyelitis had been notified in Texas as follows: Denton County, 1 case; Montgomery County, 1 case; Wharton County, 1 case, and that during the month of September 1 case had been notified in Jefferson County.

RABIES IN ANIMALS.**City Reports for Week Ended Jan. 9, 1915.**

During the week ended January 9, 1915, rabies in animals was notified by cities as follows: Everett, Wash., 3 cases in dogs; Phoenix, Ariz., 1 case in a dog.

SCARLET FEVER.

See Diphtheria, measles, scarlet fever, and tuberculosis, page 338.

SMALLPOX.**California—Imperial County.**

Acting Asst. Surg. Richter reported that during the week ended January 16, 1915, two cases of smallpox had been notified in Imperial County, Cal.

Acting Asst. Surg. Richter also reported by telegraph January 25, 1915, that during the week ended January 23, 1915, five cases of smallpox had been notified in Imperial County, Cal.

SMALLPOX—Continued.**Maryland—Cokesbury.**

Collaborating Epidemiologist Fulton reported by telegraph January 25, 1915, that a new focus of smallpox had been reported in Maryland, five cases of the disease having been notified at Cokesbury, Somerset County. The five cases all occurred in members of one family. The infection was contracted in Pocomoke City, Worcester County, Md.

Maryland—Marion.

Collaborating Epidemiologist Fulton reported by telegraph that on January 18, 1915, a new focus of smallpox infection had been reported in Maryland, two cases of the disease having been notified at Marion, Somerset County.

Tennessee—Chattanooga—Virulent Smallpox.

On January 14 Surg. Creel was ordered to proceed to Chattanooga, Tenn., to investigate the rumored prevalence of plague and smallpox at that place. January 16 he reported as follows regarding the situation:

There is no evidence of plague, but smallpox of an unusually virulent type prevails in Chattanooga. There has been smallpox in the city during the winter months for several years past, but the mortality of such cases has been nil in previous years.

According to the monthly bulletin of the Chattanooga department of health, in December, 1913, there were 24 cases of smallpox, with no death; in January, 1914, 57 cases, with no death; in February, 1914, 80 cases, with no death. From January 1, 1912, to July 1, 1914, there was one death from smallpox in Chattanooga.

The present infection can be attributed to the case of N. L., who arrived at Chattanooga from El Paso, Tex., on November 9, suffering with a very severe case of smallpox, from which he died. Subsequent to his arrival two other cases of confluent smallpox developed in the same house. The total number of cases, from the original one in November to January 15, was 56, with 16 deaths, a fatality rate of 28.6 per cent. During December there occurred 38 cases, of which 13 died. From January 1 to 15 there were 15 cases, with 2 deaths. Most of the fatal cases have been of the hemorrhagic type. With the exception of the cases of varioloid, all have been of the hemorrhagic or confluent types.

The wife of the patient in the first case stated that her husband had worked in a construction camp outside of El Paso before coming to Chattanooga; that he felt ill during the progress of his journey, and stopped over a few hours at Montgomery and also at Birmingham. At the latter place he was feeling extremely ill, and was also very ill on arriving at Chattanooga, where the eruption was noticed the following morning.

SMALLPOX—Continued.

The virulence of the disease is shown in a case which was reported on the afternoon of January 15, while I was in conference with the health authorities. The case had terminated fatally, and with the city physician I inspected the corpse. The patient had been sick three days with initial symptoms of a chill, severe headache, and backache. The attending physician had treated him for influenza. Until the day of his death no eruption had developed, but on the morning of January 15 ecchymoses and petechiæ began to appear, and shortly afterwards he had severe hematuria, and died at noon. The body presented no evidence of macular or papular eruption. It was very frankly a case of *purpura variolosa*.

In talking with the commissioner of health I stated that if any of the neighboring towns were requiring certificates of vaccination from persons coming from Chattanooga they were perfectly justified in so doing.

The total number of cases to January 15, as previously stated, was 56. The estimated population of the city is 57,000, as of July 1, 1914. The severity of the disease has had the beneficial effect of stimulating the people to be vaccinated. The city authorities have used 15,000 vaccine points, I am told, and a large number has been used by private physicians. Vaccination is not compulsory in Chattanooga except in the schools, but a large number of commercial firms have instructed their employees that they would have to be vaccinated, or lose their positions. It is believed that the people of Chattanooga are sufficiently alarmed to cooperate with the health department in securing more general vaccination.

Virginia—Parksley

Surg. Cumming reported by telegraph January 27, 1915, that two cases of smallpox had been notified in Parksley, Accomac County, Va.
